

# Passenger Terminals

SPS principals have worked with airport clients around the globe, in the Americas, Europe, Asia and Africa on all aspects of planning, delivering, and operating highly efficient and cost-effective terminal and landside facilities. The extensive years of SPS leadership experience in a vast array of international markets enables a sensitive and insightful approach to developing modern and efficient terminal facilities that achieve airport operational and security needs while providing an efficient passenger experience. Industry best practices and new technologies are applied to provide passengers with convenient levels of service, global standards of security and comfortable opportunities to enjoy retail and dining as part of their air travel experience. We apply simulation (such as CAST) and other analytical tools to optimize the functionality, layout and efficiency of terminal designs through each stage of development to optimize performance during construction and upon commissioning. We have worked with local design institutes and other program design and delivery partners to fully integrate our extensive airport terminal programming planning and design support experience with local building and development requirements, making our conceptual design process a way to fast track the development of new facilities in time to meet demand.
