

Operational Data Analytics

The smart modern airports optimize performance through situational awareness based on the accessing and analysis of real-time data feeds of all movements on airport: aircraft, ground vehicles, passengers, baggage and cargo. Data feeds compiled in dashboard can be used by airport operations and airline staff for collaborative decision making to provide instant response adjustments to gate assignments, passenger notifications and security alerts. SPS principals, key staff and our affiliates have experience in the collection of data feed and operational analytics to maximize performance efficiency.
